

# SECURITY WHITEPAPER

**UNMAND**

This whitepaper outlines how Unmand keeps its cloud systems secure, the steps we take to build security into our products, and the role your organisation plays in keeping your work environment secure.

Our security approach focuses on security governance, risk management and compliance. This includes encryption at transit, IP restrictions, role-based access control, system monitoring, logging and alerting, and more.

We apply security best practices and manage platform security so customers can focus on their business. Our products are designed to protect customers from threats by applying security controls at every layer from the physical to application, while keeping the ability to rapidly deploy security updates without customer interaction or service interruption.

# PRODUCT SECURITY

We constantly strive to achieve the right balance between releasing features that matter to you and deploying secure products. The following features and activities help keep our products, and your data, safe.

## **ROLE & PROJECT ACCESS CONTROLS**

Access to data within Unmand's portal is governed by role and project-based controls and can be configured to define granular access privileges. There are permission levels for read, write and administrator.

## **IP RESTRICTIONS**

Unmand products can be configured to only allow access from specific IP address ranges you define. This access is configurable at an organisation level directly within the Unmand portal.

## **TWO FACTOR AUTHENTICATION**

Unmand secures your account with enforced two factor authentication. Anyone accessing their account must have both a password and a one-time access code generated on their mobile device.

## **DATA RETENTION**

You can set the retention period for your data directly in the portal. This can be set from no data retention, to up to 90 days.

## **ENCRYPTION AT REST**

All data sent is encrypted in transit and customer data is encrypted at rest. We use Transport Layer Security (TLS) 1.0, 1.1, 1.2 to protect data from unauthorized disclosure or modification. Our implementation of TLS enforces the use of ciphers & key lengths.

## **AUDIT AND LOGGING**

We maintain comprehensive logs of all activities and actions for each product. These logs can be used for your audit purposes or internally for troubleshooting and support.

## **SECURE DATA STORAGE**

Unmand follows secure credential storage best practices by never storing passwords in a plain text format. Passwords are salted and repeatably hashed before being stored.

## **SESSION MANAGEMENT**

The location and IP address of each session is recorded, and you can revoke any sessions you don't recognise. Administrators can review all active sessions in the Unmand portal.

# DATA SECURITY

## **DATA OWNERSHIP**

Your data 100% belongs to you. Unmand does not sell your data to third party providers. Unmand has a published privacy policy that clearly defines what data is collected and how it is used. We will never sell or transfer your data to a third party without your consent. For additional information see:

<https://unmand.com/privacy>

## **DATA BACKUPS**

Daily snapshots are retained for 30 days to support point-in-time recovery and are encrypted using AES-256 encryption. Backups are replicated to multiple data centres within a particular region.

## **DATA RETENTION**

You can control the retention period for your data directly in the Unmand portal. This can be set from no data retention, to up to 90 days.

## **GENERAL DATA PROTECTION REGULATION**

Unmand is committed to compliance with GDPR and have implemented a wide range of technical and organisational measures. This includes the ability for customers to delete information and data uploaded to any of Unmand's products.

# PHYSICAL SECURITY

## INFRASTRUCTURE

Unmand's physical infrastructure is hosted and managed within Amazon Web Services (AWS). Amazon continually manages risk and undergoes recurring assessments to ensure compliance with industry standards. Amazon's data centre operations have been accredited under:

- ISO 27001
- SOC 1 and SOC 2/SSAE 16/ISAE 3402
- Sarbanes-Oxley (SOX)
- PCI Level 1
- FISMA Moderate

## ON SITE PREMISES

Access to Unmand's offices is restricted to authorised personnel. We deploy several security features such as individualised swipe card access, security video feeds, intrusion detection technology, and other security measures.

# PERSONNEL SECURITY

## BACKGROUND CHECKS AND ACCESS

Each team member has an extensive background check and undergoes comprehensive training on data security protocols. Only a limited number of staff members can access customer data.

## CONFIDENTIALITY AGREEMENT

All employees are bound by non-disclosures and confidentiality agreements.

## CONTINUOUS EDUCATION CAMPAIGN

Unmand provides staff with continuous communication on emerging threats, performs phishing awareness campaigns, and communicates with staff regularly.

## **SECURITY CHAMPION PROGRAM**

Unmand nominates a security lead within every one of our product and service teams. Champions are provided with dedicated training to help them understand and identify application security vulnerabilities and leading secure development practices.

## QUALITY CONTROL

### **PEER CODE REVIEWS**

Whether it's a new feature or a bug fix, every line of code is reviewed by peers before being released to production. Security reviews are performed as appropriate for the work.

### **CONTINUOUS INTEGRATION AND DELIVERY**

Every code release is automatically subjected to a pipeline of rigorous tests and analysis before it is merged. Our continuous deployment system and development process allow us to rapidly update and patch our system whenever needed.

### **SEPARATE ENVIRONMENTS**

The development and testing environments are logically separated from the Production environment.

## DISASTER RECOVERY

### **GLOBAL RESILIENCY**

We maintain multiple geographically separated data replicas and hosting environments to minimise the risk of data loss or outages. Using AWS gives Unmand the ability to remain resilient globally even if one location goes down.

### **CUSTOMER DATA BACKUPS**

Unmand performs regular backups of account information, and other critical data using Amazon S3 cloud storage. All backups are fully encrypted in transit and at rest. Backup files are stored across multiple availability zones to ensure no outages

# SUMMARY

Unmand's cloud platform enables businesses to deliver superior customer experiences by automating mundane tasks, reducing errors and streamlining existing processes. Security mechanisms to protect physical, network and application components of the platform, coupled with transparency about security practices and compliance best practices, give customers the confidence they need to move automation to the cloud.
